DISEASE: DEFECTS IN PKD1 ARE THE CAUSE OF AUTOSOMAL DOMINANT POLYCYGTIC KIDNEY DISEASE (ADPKD), A COMMON AUTOSOMAL DOMINANT GENETIC DISEASE AFFECTING ABOUT 1 OUT 1000 INDIVIDUALS. IT IS CHARACTERIZED BY PROGRESIVE FORMATION AND ENLARGEMENT OF CYSTS IN BOTH KIDNEYS, TYPTCALLY LEADING TO END-STAGE RENAL DISEASE IN ADULT LIFE. CYSTS ALSO OCCURS IN THE LIVER AND OTHER ORGANS. SIMILARITY: THE REPEATED LEUCING-RICH (LRR) SEGMENT IS FOUND IN MANY PROTEINS. NUMBER IN THIS PROTEIN: 2, FRAMED BY A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PRINTS; PR00500; POLYCYSTIN.
PR05TIE; PS5041, C_TYPE_LECTIN_2; 1.
Signal; Leucine-repeat; Lectin; Repeat; Glycoprotein; Transmembrane; Disease mutation; Polymorphism; 3D-structure.
                                                                                                       (PKD).
                                                                                        LRR N-FLANK AND LRR C-FLANK.
SIMILARITY: CONTAINS 16 POLYCYSTIC KIDNEY DISEASE DOMAINS (PR SIMILARITY: CONTAINS 1 LDL-RECEPTOR CLASS A DOMAIN (ATYPICAL, THE POTENTIAL CALCIUM-BINDING SITE IS MISSING).
SIMILARITY: CONTAINS 1 C-TYPE LECTIN FAMILY DOMAIN.

"Cloning of a novel water and urea-permeable aquaporin from mouse expressed strongly in colon, placenta, liver, and heart.";

Biochem. Biophys. Res. Comun. 246:324-328(1997).

-I-FINCTION: FORMS A WATER-SPECIFIC CHANNEL; MERCURY-SENSITIVE. ALSO PERMEABLE TO UREA BUT NOT TO GIVEGRAC.

-I-SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-I-TISSUE SPECIFICITY: COLON, LIVER, HEART AND PLACENTA.

-I-SIMILARITY: BELONGS TO THE TRANSMEMBRANE CHANNEL MIP FAMILY.
                                                                                                                                                                                                 Gaps

"Molecular cloning of a new aquaprin from rat pancreas and liver.";
J. Biol. Chem. 272:30329-3033(1997).
-!- FUNCTION: FORMS A WATER-SPECIFIC CHANNEL; MERCURY-SENSITIVE. IT MAY HAVE AN IMPORTANT ROLE IN SPERMATOGENESIS, IN FERTILIZATION, AND IN THE SECRETION OF PANCRETIC JUICE AND SALIVA.
-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
-!- TISSUE SPECIFICITY: HIGHLY EXPRESSED IN SPERM, PANCREAS AND LIVER.
SOME EXPRESSION HAS BEEN FOUND IN SALIVARY GLAND AND ABSORPTIVE COLONIC EPITHELIAL CELLS.
                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rattus norvegicus (Rat).

Bacteriol. 175:7918-7930(1993).

-!- FUNCTION: LIPOAMIDE DEHYDROGENASE IS A COMPONENT OF THE ALPHA-KETOACID DEHYDROGENASE (BY SIMILARITY).

-KETOACID DEHYDROGENASE COMPLEXES (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: DIHYDROLIPOAMIDE + NAD(+) = LIPOAMIDE + NADH.

-!- COFACTOR: FAD (BY SIMILARITY).

-!- SUBGENIT: HOMODIMER (BY SIMILARITY).

-!- SUBCELLUAR LOCATION: CYTOPLASMIC.

-!- MISCELLANEOUS: THE ACTIVE SITE IS A REDOX-ACTIVE DISULFIDE BOND.

-!- SIMILARITY: BELONGS TO THE PYRIDINE NUCLEOTIDE-DISULFIDE

OXIDOREDUCTASES CLASS-I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PFAM: PF00070: pyr_redax; 1.

The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitide epitopes for generating vaccines against a disease associated
                               or artigonists (Tb) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune responses, e.g. in vaccinated subjects, to prevent an autoimmune percent of cancer immunotherapy (i.e. to prevent attack on normal but generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA response. Cytotoxic T sequence represents a specifically claimed example of (Ia).
                 present invention describes peptides (A) that comprise agonists (Ia)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        T cell epitope; immune response; human leukocyte antigen; HLA Class I; vaccine; immunogenic; major histocompatablilty complex; MHC; B cell; disease; anti-tumour; anti-viral.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptides W39430-W39734 are used in a novel method for the selection of

with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptide W39723 is derived from the human carcino-embryonic antigen (CEA) and has the ability to bind to the human MHC Class I allele HLA-A2.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The peptide epitope W77119-W77138 were created for human tumour-specific cytocoxic T lymphocyte response. These peptides are are cysteinedepleted mutants of a mative disease-specific CTL epitope. The cysteinedepleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a disease-specific immunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an anitigen with the same epitope, or with a different cross-reactive
                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disease specific immunogen - comprises disease specific cytotoxic lymphocyte epitope used to elicit melanoma specific CTL response

                                                                                                                                                                                                                                                                                                                           16-SEP-1999.
                                                                                                                                                                                                                                                 Synthetic.
                                                                                                                                                                                                                    vaccine;
                                                             Y47655;
                 147655
                                                             antigen that binds class I major histocompatibility complex (MHC) molecules with antigen presenting cells (APCs) pretreated with pretreatment growth factors, and incubating the APCs with purified CDB cells in the presence of at least 2 incubation growth factors, thereby producing antigen-specific CTLs. A method for specifically killing target cells in a human patient is also provided which comprises obtaining a fluid sample containing CTLs from a patient, contracting the cytocoxic T cells with APCs pretreated with pre-treatment growth factors, where the APCs comprises class I MHC molecules. The pretreated APCs are incubated with the cytocoxic growth factors, thereby producing activated cTLs which are contacted with a carrier to form a composition. The activated composition can then be administered to the patient. The activated CTLs can be used for treating cancers, immune disorders, viral infections, and DSC, hepatitis, bacterial infection, fungal infection, malaria or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences shown in W70044 to W70052 represent peptides derived from carcinoembryonic antigen (CEA). The peptides can bind to a human leukocyte antigen (HLA), HLA-A2.1 and are used to exemplify the method of invention of producing antigen-specific cytotoxic T cells (CTLs) in vitro. The method comprises contacting immunogenic peptides from an
                                                                                                                                                                   human leukocyte antigen; HLA; tumour associated antigen; cancer; antigen presenting cell; APC; immunogenic peptide; immune disorder; viral infection; AIDS; hepatitis; bacterial infection; malaria; CEA; fungal infection; tuberculosis; melanoma; carcinoembryonic antigen.
                                                                                                                                                     Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC;

having a human major histocompatibility complex (MHC) Class I (also having a human major histocompatibility complex (MHC) Class I (also having a human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CE HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cepproses egainst the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and the particularly important in tumour rejection and in fighting viral infections are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) cor prevent viral infections and cancers in mammals (especially humans) corprevent viral infections as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, panticularly for treating gastrointestinal, breast, panticularly for treating of prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

or antigonists (1b) of human carcinoembryonal antigon (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating asstrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA.specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but GEA-expressing cells). (Ia) are more active than native sequence (I) and generated recognize both (Ia) and native CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunogenic peptide having a human leukocyte antigen binding motif #1166.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes peptides (A) that comprise agonists (Ia)

```
The invention relates to a method for the production of non-immunogenic acid sequence of the protein. (b) identifying in the amino acid sequence of the protein, (b) identifying the amino acid sequence on or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins. e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the protein sequence of vaccine 2 708 VI.
                                                                                                                                                                                                         Reducing immunogenicity of proteins - by modifying the amino acid sequence of the protein to eliminate potential epitopes for T-cells of a given species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 36; DB 20; Length 107;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             having a human major histocompatibility claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CHA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumnour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also used to treat chronic or acute conditions. They are also produce CTLS ex vivo for infusion back into a patient. The produce CTLS ex vivo for infusion back into a patient. The processe, by contacting a cytotoxic T cell with the peptide e.g. to the contacting a minimical particular and also useful

                                                                                                                                                      0
                 Carcinoembryonic antigen fragments – used in assays to determine the presence and amt. of the antigen in samples also contg. related antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in R77435-38 are chimaeric proteins comprising portions of human biliary glycoprotein (BGP) and the human membranebound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PR1A3 epitope. The PR1A3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PR1A3 antibodies
                                                               CEA fragments can be used in assays to determine the presence and amt. CEA in samples which also may contain related antigens including its normal cross-reacting antigen or the 128~{\rm kD} antigen.
                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                   Primer; amplify; polymerse chain reaction; PCR; human; blilary glycoprotein; BGP; membrane-bound; carcinoembryonic antigen; CER; chimmeric protein; PRLA3 epitope; anti-PRLA3 antibody; colorectal carcinoma; monoclonal antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New molecules which bind carcinoembryonic antigen - used for the diagnosis, and treatment of colorectal carcinoma and for isolation

indicating that the PRIA3 epitope is not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they specifically bind and the imaging and treatment of cells exhibiting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in R77435-38 are chimaeric proteins comprising portions of human bilary glycoprotein (BGP) and the human membrane-bound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PRLA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies indicating that the PRIA3 epitope is not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     biliary glycoprotein; BGP; membrane-bound; carcinoembryonic antigen; CEA; chimaeric protein; PR1A3 epitope; anti-PR1A3 antibody; colorectal carcinoma; monoclonal antibody.

in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they specifically bind and the imaging and treatment of cells exhibiting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in R77435-38 are chimaeric proteins comprising portions of human billary glycoprotein (BGP) and the human membrane-bound carcinoembryonic antigen (CEA). These chimaeric proteins were used to identify the PRIA3 epitope. The PRIA3 epitope was found to be an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA is no longer membrane bound did not react with anti-PRIA3 antibodies indicating that the PRIA3 epitope is not present in non-membrane bound hybrid proteins. Antibodies which recognise the PRIA3 epitope are used
                                                                                                                                                                                                                                                                                                                                                                                                                                   Primer; amplify; polymerse chain reaction; PCR; human;

in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRIA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they specifically bind and the imaging and treatment of cells exhibiting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               portions of human biliary glycoprotein (BGP) and the human membrane-
bound carcinoembryonic antigen (CEA). These chimaeric proteins were
used to identify the PRIA3 epitope. The PRIA3 epitope was found to be
an epitope of CEA within the B3-GPI region. Chimaeras in which the CEA
is no longer membrane bound did not react with anti-PRIA3 antibodies
indicating that the PRIA3 epitope is not present in non-membrane bound
hybrid proteins. Antibodies which recognise the PRIA3 epitope are used
                                                                                                                                                                                 Gaps

ö
in the detection of well and poorly differentiated colorectal carcinomas. The isolation of the specific PRLA3 epitope allows the development of monoclonal antibodies specific for colorectal carcinoma. They can be used in the study, isolation and purification of molecules to which they specifically bind and the imaging and treatment of cells exhibiting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Afolio. CEA is free from cross-reactive CEA-like antigens, it is antigenically indistinguishable from the solution form of CEA shed from tumour cells, and it is devoid of ethanolamine. R60619 can be used in a reagent composition for detecting neoplastic diseases in biological samples, or in an immunoassay process where it can specifically detect the presence of tumour cells in a biological sample e.g. blood.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Q71567 is the DNA sequence which encodes carcinoembryonic antigen (CEA)

-!- FUNCATION: STIMULATES CARDIAC OUTPUT AND HINDGUT MOTILITY,
MODULATES VISCERAL AND SKELETAL MUSCLE IN MANY ARTHROPODS.
-!- TISSUE SPECIFICITY: FOUND IN THE LATERAL WHITE NEURONS AND IN
THE CRAB PERICARDIAL ORGANS.

-!- FUNCTION: THIS HORMONE, RELEASED FROM CELLS IN THE CORPORA

-!- FUNCTION: THIS HORMONE, RELEASED FROM CELLS IN THE CORPORA
CARDIACA AFTER THE BEGINNING OF FLIGHT, CAUSES RELEASE OF
DIGLYCERIDES FROM THE PAT BODY AND THEN STIMULATES THE FLIGHT
MUSCLES TO USE THESE DIGLYCERIDES AS AN ENERGY SOURCE.
-!- SIMILARITY: BELONGS TO THE AKH / HRTH / RPCH FAMILY.
